# Koganei Clean System products provide complete support for the maintenance of a clean environment inside the cleanroom. 

Koganei Clean System products meet the needs of the ultra-clean production environment. In everything from actuators and valves to air preparation and auxiliary equipment, anti-corrosion materials processing and other Koganei-developed design concepts serve to prevent particle contamination within the cleanroom. These perfectly designed mechanisms, which resolve even the slightest leaks to the outside during operations, have already won a high level of reliability.

## Koganei Cleanliness

There is currently no standard in JIS or elsewhere for methods of evaluating cleanliness for pneumatic equipment in the cleanroom specifications. Therefore, to measure the effects of cleanroom contamination by pneumatic equipment, Koganei has decided to use "number of particles generated per 10 operations," rather than particle density. Koganei has also developed classifications for application classes in cleanroom, based on JIS and other upper limit density tables, and on the company's own experience.

Remarks: 1. In the above table, product performance in terms of the number of particles generated per 10 operations is expressed as the upper limit of particles corresponding to the equivalent JIS or ISO class.
2. In the above table, values in the JIS, ISO, and FED-STD upper limit density tables are calculated as upper density per liter.
3. The classes shown are clean levels as classified in JIS and ISO.

From the above definitions, the Koganei clean level classes can be viewed as the level of average contamination per liter of surrounding air over a period of 10 operations in cleanroom. Air ventilation in cleanrooms is usually faster than 1 cycle per minute, and clean volumetric capacity is usually larger than 1 liter, which should provide a sufficient safety margin in practice.

Caution: The above conclusions are based on an ideal situation in which air ventilation is being implemented. For specific cases where air ventilation is not ensured, caution is needed since the clean classes cannot be maintained.

The clean system diagrams shown here are for Class 5 equivalent products. For Class 4 or Class 3 equivalent products, consult us.

## Evaluations of Cleanliness

Koganei has therefore specified its in-house measurement methods, to conduct evaluations on the cleanroom rating.

The number of particles of the Air Cylinder Cleanroom Specification is measured as shown in the method below.

## 1. Measurement conditions

1-1 Test circuit: Figure 1 (no suction), Figure 2 (with suction)

1-2 Operating conditions of tested cylinder
Operating frequency: 1 Hz
Average speed: $500 \mathrm{~mm} / \mathrm{s}$ [20in. $/ \mathrm{sec}$.]
Applied pressure: 0.5 MPa [73psi.]
Suction condition: Microejector ME05, Primary side: 0.5 MPa [73psi.] applied, Tube: $\phi 6$ [0.236in.]
Mounting direction: Vertical
Chamber volume: $8.3 \ell$ [0.293 $\mathrm{ft}{ }^{3}$ ]

## 2. Particle counter

Manufacturer/model: RION/KM20
Suction flow rate: $28.3 \mathrm{l} / \mathrm{min}$ [ 1 ft . $/ \mathrm{min}$.]
Particle diameter: $0.1 \mu \mathrm{~m}, 0.2 \mu \mathrm{~m}, 0.3 \mu \mathrm{~m}, 0.5 \mu \mathrm{~m}, 0.7 \mu \mathrm{~m}, 1.0 \mu \mathrm{~m}$

## 3. Measurement method

3-1 Confirmation of number of particles in the measurement system
Under the conditions in the above 1 and 2 , using a particle counter to measure the sample for 9 minutes without operating the measurement sample, and confirmed the measured number of particle is 1 piece or less.
3-2 Measurement under operation
Under the conditions in the above1 and 2, operating the measurement sample for 36 minutes, and measured the total values in the latter half of 18 minutes test.
3-3 Reconfirmation
Performed the measurement in 3-1 again, to reconfirm the number of particles in the measurement system.

## 4. Measurement results

- Cleanroom specification

Jig Cylinder (no suction from dust collection port)
Particle generation over 1 million operations (CS-CDA16×30)

- Cleanroom specification

Slim Cylinder (with suction from dust collection port)
Particle generation over 1 million operations (CS-DA20×100)

For "safety precautions" listed in the Clean System Product Drawings, see the materials below.

- For actuators, see "Safety Precautions" on p. 45 of the Actuators General Catalog .
- For valves, see "Safety Precautions" on p. 31 of the Valves General Catalog.
- For air treatment and auxiliary equipment, see "Safety Precautions" on p. 31 of the General Catalog of Air Treatment, Auxiliary, Vacuum.

## Order Codes

## Sensor Switch Operating Range and Response Differential

Open/closed stroke differential (Open/closed angle differential)
The stroke differential (angle differential) between the point where the lever on one side moves and turns the switch ON and the point where the switch is turned OFF as the lever travels in the opposite direction.
Operating position repeatability
When the lever on one side moves in the same direction, operating position repeatability is defined as the range of the deviation of the position where the switch is turned ON or turned OFF.

Parallel type linear guide specification

| Parallel type linear guide specification |  |  |  | $\mathrm{mm}[\mathrm{in}]$. |
| :--- | :---: | :---: | :---: | :---: |
| Model | Open/closed stroke differential | Operating position repeatability |  |  |
| (CS-)NHB $\square$ PG(L,Y)-8 | $0.5[0.020]$ | $0.2[0.008]$ |  |  |
| (CS-)NHB $\square$ PG(L,Y)-10 | $0.5[0.020]$ | $0.2[0.008]$ |  |  |
| (CS-)NHB $\square$ PG(L,Y)-16 | $0.8[0.031]$ | $0.2[0.008]$ |  |  |
| (CS-)NHB $\square$ PG(L,Y)-20 | $0.8[0.031]$ | $0.2[0.008]$ |  |  |

Remark: The above table shows reference values.

Tighten the mounting screw after the sensor switch is inserted in the switch mounting groove in the direction of the arrow in the diagram and move to the proper location. Tightening torque of the mounting screw is $0.1 \sim 0.2 \mathrm{~N} \cdot \mathrm{~m}[0.9 \sim 1.8 \mathrm{in} \cdot \mathrm{lbf}]$.

Caution: Care must be exercised that the sensor switch cannot be inserted into the switch mounting groove from the diagram's top direction.

Caution: Care must be exercised that a sensor switch cannot be mounted when the body is installed by using thru holes, as shown in the diagram to the right.

Adjusting Sensor Switch Mounting Position (Mount the sensor switch so that the surface showing the model marking faces up.)

(1) Confirm workpiece is internally gripped.

(3) By moving the sensor switch in the direction of the arrow, the lamp turns ON , and by moving it further, the lamp turns OFF.

(4) By moving back the sensor switch in the direction of the arrow (opposite direction), the lamp turns ON , and it should be secured by the sensor switch mounting screw after moving it about 0.3 mm [0.012in.] further.
 gripped.
Remark: (1) shows the desired location for the switch to turn ON. Install and adjust it in accordance with (1) ~ (4) above.

(4) Secure the sensor switch by the mounting screw after moving it about 0.3 mm [0.012in.] further in the direction of the arrow from where the lamp turned ON in (3).
